This map is to be used only as a generalized guide to those areas in which storm generated debris flows are most likely to occur.

Shown in yellow are those upland areas with 26 ^{o} or steeper slopes, steep enough to generate debris flows under proper rainfall conditions.

SPECIAL NOTE

This map is not intended nor suitable for site-specific purposes. Although site-specific assessments are often needed, it is neither possible nor appropriate to render such an assessment based only on the generalized information depicted on this map. A registered geologist or certified engineering geologist should be consulted to evaluate issues of slope stability for residences or other sites.
